

Lab 04 — Publish the Site: GitHub Pages and Sites

Agentic AI Applications with Codex · Day 1 · Codex → GitHub Pages → @Sites

Course: Agentic AI Applications with Codex (TGS-2023041081)

Day 1 · Topic 1 · about 25 minutes · slides 50–54

Surface: Codex → GitHub Pages → @Sites

Features: git · GitHub Actions · GitHub Pages · @Sites access control

The story so far

Investors want a link, not a laptop demo — and every improvement from now on should land on a live site, not sit in a folder. Publish it: publicly on GitHub Pages for customers, privately on Sites for investors.

Your goal

A site on your laptop helps nobody. Put it online now, so every lab after this improves a live site.

You'll build

A public GitHub Pages site for customers and a private Sites copy for investors

What is in this folder

- `assets/pages-basic.yml`
- `assets/publish-checklist.md`
- `prompts.md` / `prompts.pdf` — every prompt, ready to paste
- `evidence/checklist.md` — what to capture as proof

Step by step

1. **Create the repo** — On `github.com` create `cook-and-bake` (or run `gh repo create`), then add it as the remote.
2. **Add the workflow** — Copy `pages-basic.yml` to `.github/workflows/pages.yml`. It publishes the static files.
3. **Commit and push** — Paste Prompt A. Read the file list before Codex commits.
4. **Turn on Pages** — Repo Settings → Pages → Source: GitHub Actions. Watch the Actions run turn green.
5. **Publish on Sites too** — Paste Prompt B for the private investor copy.
6. **Test on a phone** — Open both URLs on your phone and sign up for one course.

The prompts

PROMPT A — Codex

Commit and push this project to GitHub.

Before committing, list every file you will add and confirm there is no .env file, API key or sign-up export among them. Write a commit message that says why, not what. Push to main, then give me the GitHub Actions run URL and the Pages URL.

PROMPT B — @Sites

@Sites Deploy this project as a static site. It is plain HTML, CSS and JavaScript with no backend. Check compatibility, publish it, set access to Only those invited, and give me the URL.

Check your work

- ☐ Codex listed the files and none is a secret or an export.
- ☐ The Actions run is green and the Pages URL loads 20 courses.
- ☐ A sign-up works on the live Pages site from your phone.
- ☐ The Sites copy is live and set to Only those invited.
- ☐ You can say which URL is for customers and which for investors.

If it goes wrong

- **Pages shows 404** — Source must be "GitHub Actions", and the first deploy takes a minute or two.
- **courses.json not found online** — Paths on Pages are case-sensitive: data/courses.json is not Data/Courses.json.

Stretch

- Add a custom domain under Settings → Pages (needs a DNS record).

Why it matters: Publish early. From now on every lab ends with a push, and the live site is the one you test.

Next

Lab 5 — Turn the Brochures into a SQLite Knowledge Base. Keep what you built — the next lab starts from it.

Safety

Use only this lab's synthetic data and your own accounts. Never paste a real API key, password or personal data into a prompt or a file. Every email address in the data must resolve to your own inbox. Nothing is published or sent without your explicit approval.
